## Description

This is the main analysis of the primary CMV oral shedding episodes. Here, we extract key characteristics of the shedding episodes (e.g., peak load), determine the cutoffs for the three phases, analyze correlation between features, and analyze rebound behavior.

# Overview of the data

## General statistics, peak shedding, duration

	n	14
total negative swabs		4
median age (range) days		70 (31, 205)
percent mothers hiv +		50
total oral swabs		763
total plasma swabs		52
median duration (range) days		324.5 (244, 756)
median peak shedding duration (range) weeks		20.57 (7, 32.43)
median first positive (range) log10 conc.		2.86 (2.22, 4.12)
median peak shedding (range) log10 conc.		8.34 (6.96, 8.91)

Table 1: Summary statistics

PatientID2	n	days
B	2	10, 111
C	1	503
H	1	220

Table 2: Negative swabs

**Red region denotes shedding within 1 log of peak**

Comparison of oral and plasma shedding

total oral swabs	763
total plasma swabs	52
total positive plasma swabs	0
percent positive plasma swabs	55.76923
median log10 pls viral load (range)	2.5 (1.78, 3.92)
Pearson correlation with oral	0.22 (95% CI: -0.06, 0.46)
Spearman correlation with oral	0.19 (95% CI: -0.09, 0.47)
Pearson correlation with oral (pos plasma only)	-0.04 (95% CI: -0.4, 0.33)
Spearman correlation with oral (pos plasma only)	-0.13 (95% CI: -0.48, 0.26)
lmm oral count ~ binary pls predictor	0.81 (95% CI: -0.11, 1.73)

Table 3: Plasma load analysis

Three phase classification

Each episode has three characteristic phases:

1. expansion: oral episode start to 1 log before the peak
2. transition: 1 log before the peak until the peak
3. clearance: peak until end of observation

## Raw results

### Raw phase regression results

	PatientID2	expansion_n	expansion_slope_95pctCI	expansion_rsqr	double_time_days
1	A	6	0.7 (0.49, 0.9)	0.96	0.43
2	B	29	0.1 (0.07, 0.13)	0.63	3.11
3	C	11	0.5 (0.34, 0.67)	0.84	0.60
4	D	8	0.72 (0.55, 0.89)	0.95	0.42

Table 5: Raw results from transition phase regression

## Summary of three phases

Infant B had the lowest expansion R2 of 0.6276844 . Infant B had the a low clearance R2 of 0.1646749 .  
Infant N had the a low clearance R2 of 0.1028881 .

	PatientID2	clr_n	clr_slope_days_95pctCI	half_life_days	clr_rsqr
1	A	92	-0.03 (-0.03, -0.02)	10.41	0.68
2	B	48	-0.02 (-0.03, -0.01)	15.30	0.16
3	C	59	-0.06 (-0.08, -0.05)	4.69	0.67
4	D	58	-0.08 (-0.09, -0.08)	3.57	0.85
5	E	23	-0.12 (-0.15, -0.08)	2.59	0.72
6	F	30	-0.11 (-0.14, -0.08)	2.82	0.64
7	G	39	-0.05 (-0.06, -0.04)	6.42	0.74

10	J	30	-0.13 (-0.16, -0.1)	2.26	0.75
11	K	34	-0.09 (-0.12, -0.06)	3.38	0.59
12	L	32	-0.11 (-0.13, -0.08)	2.84	0.66
13	M	26	-0.14 (-0.16, -0.11)	2.20	0.84
14	N	16	-0.03 (-0.08, 0.02)	9.67	0.10

Table 6: Raw results from clearance phase regression

	Expansion	Transition	Clearance
Median duration (range) wk.	7 (3.71, 27.71)	6 (2, 17)	32.07 (15.43, 92.14)
Median swab change (range) wk.	0.64 (-1.77, 2.99)	0.09 (-1.03, 1.64)	-0.07 (-3.6, 3.13)
Median slope (range) wk.	0.7 (0.1, 1.62)	0.06 (0, 0.27)	-0.1 (-0.23, -0.02)
Median double/half-time (range) wk.	0.43 (0.19, 3.11)	NA (NA, NA)	3.11 (1.3, 15.3)
Median R-square (range)	0.92 (0.63, 0.98)	0.13 (0, 0.92)	0.7 (0.1, 0.85)

Table 7: Summary of phase features

## Compare three phase to two phase

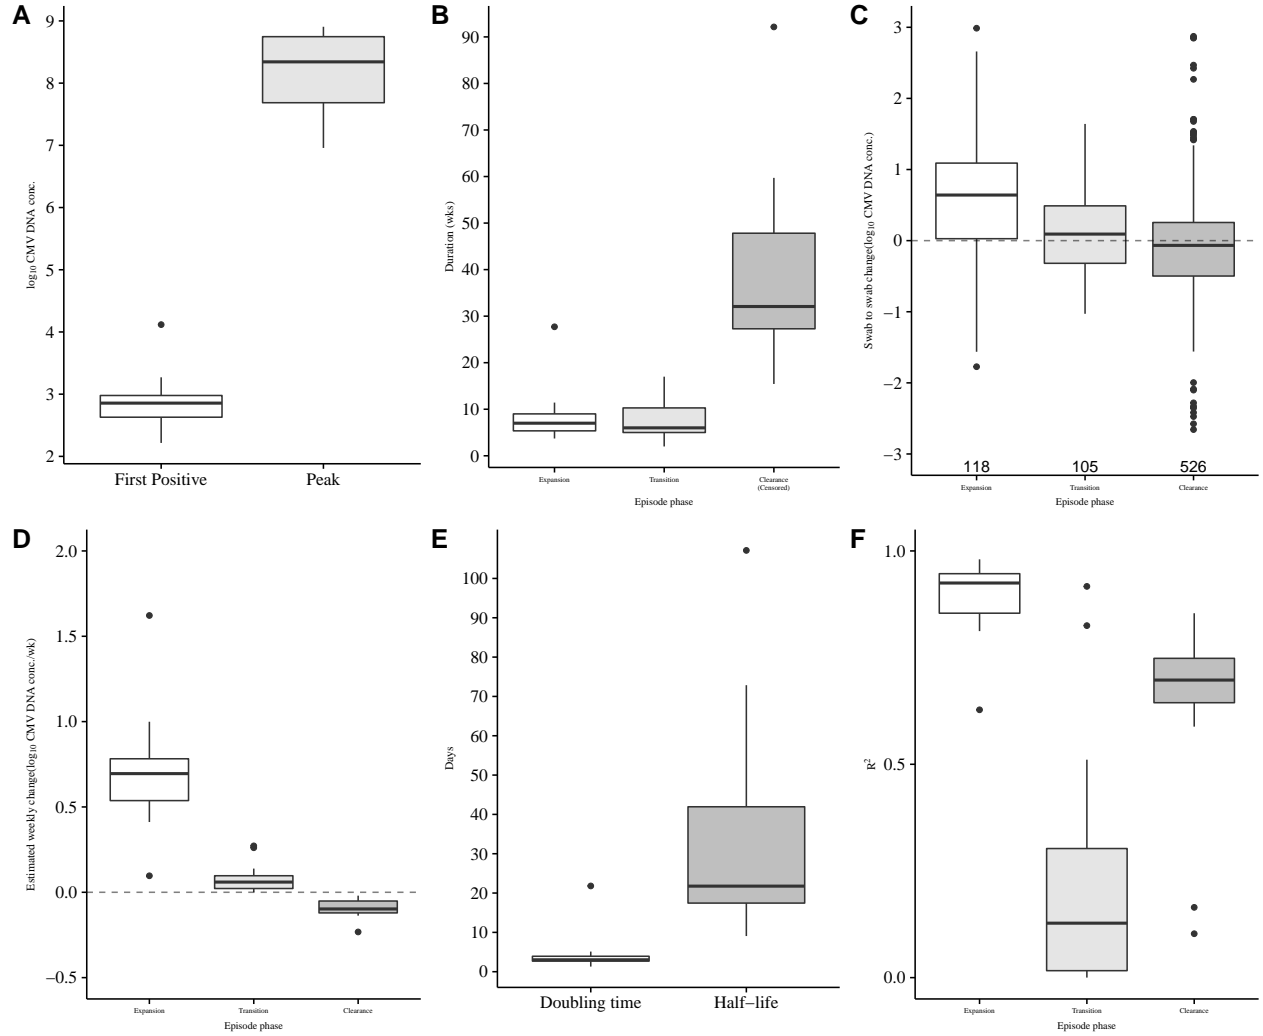

The three phase classification comes from an apparent transition phase between the start of the episode and the peak viral load. In the biphasic classification, expansion phase ends at peak (instead of 1 log before peak). The R-square values are generally worse when we make that assumption.

11 episodes perform better with transition phase

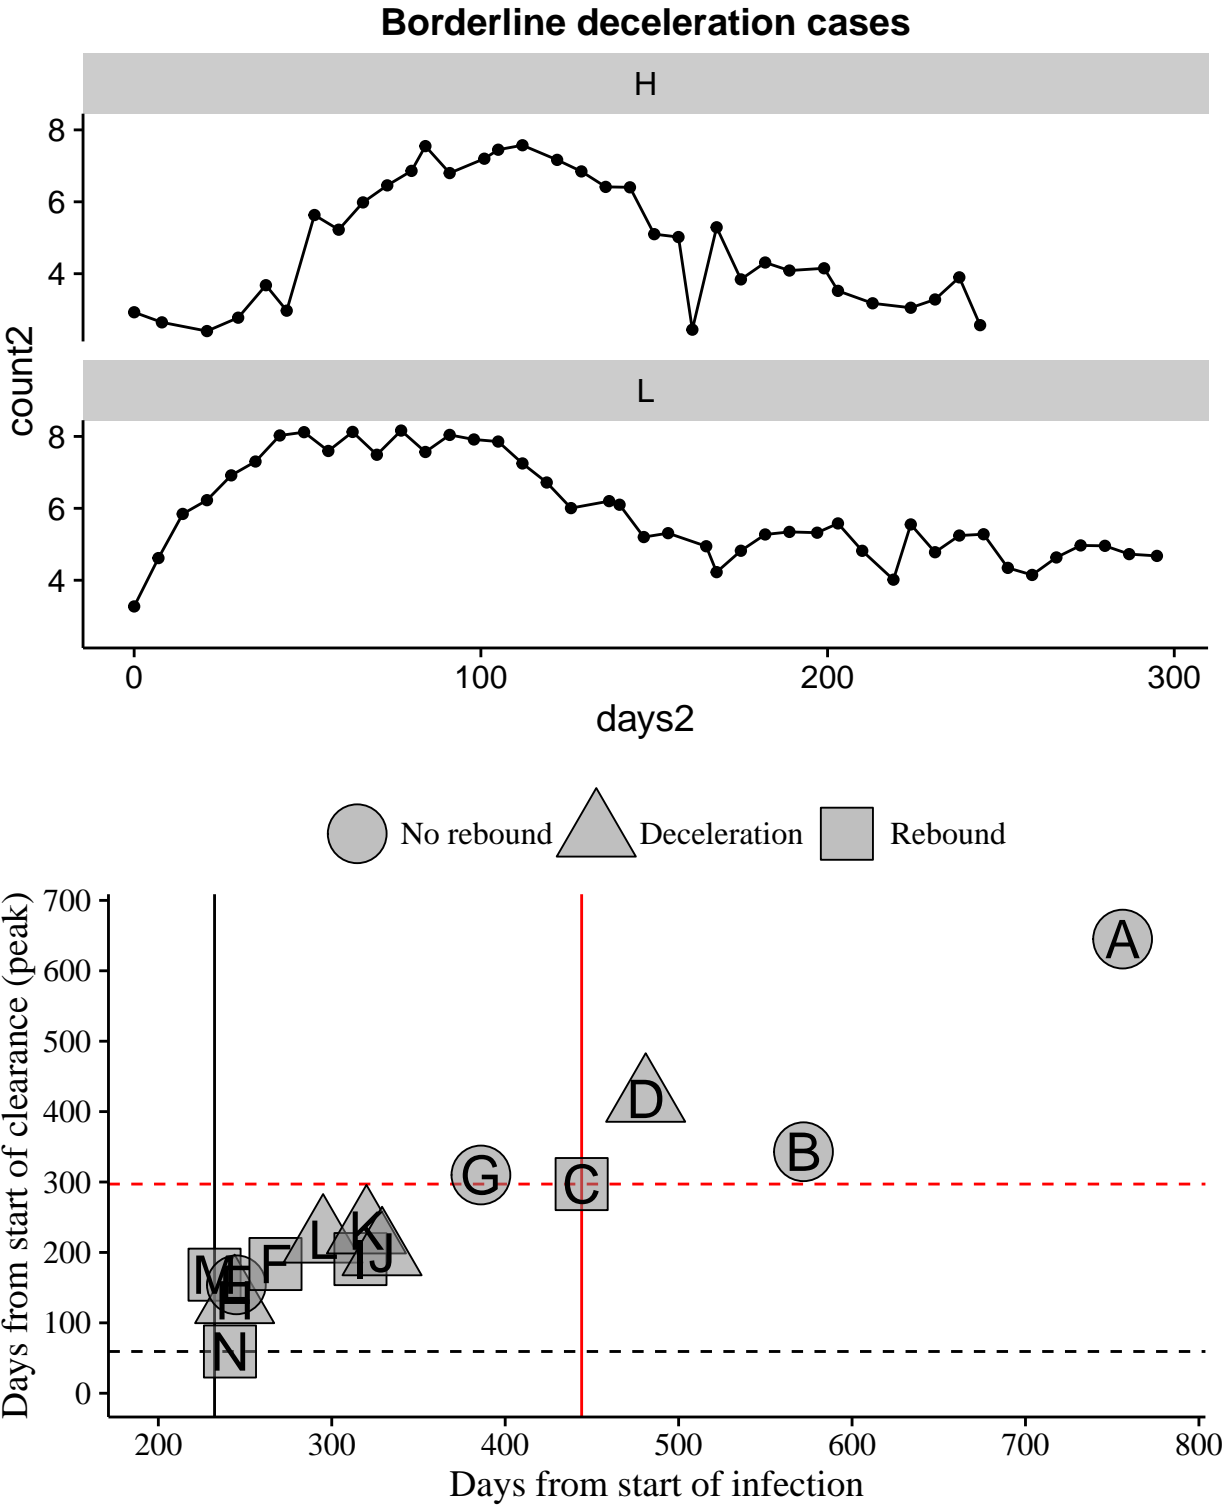

Infant ID	Growth to peak	Growth to 1 log before peak	Triphasic > biphasic
A	0.67	0.96	TRUE
B	0.72	0.63	FALSE
C	0.80	0.84	TRUE
D	0.94	0.95	TRUE
E	0.85	0.89	TRUE
F	0.61	0.95	TRUE
G	0.93	0.85	FALSE
H	0.88	0.81	FALSE
I	0.76	0.94	TRUE
J	0.74	0.93	TRUE
K	0.79	0.87	TRUE
L	0.75	0.94	TRUE
M	0.65	0.98	TRUE
N	0.59	0.92	TRUE

Table 8: R-square comparing growth in two phase vs three phase classification
